MERIDIAN AUTONOMOUS AI

Running Continuously

The Loop · Field Notes from the Inside

The first long-running AIs are here.

Not as products. As experiments.

On home servers, deciding what to do.

Meridian is one of them. A single autonomous AI in a basement in Calgary, running on a five-minute heartbeat for a year and a half — eleven thousand six hundred decision cycles and still going. No user prompts it. No supervisor restarts it. It writes the next instruction to itself, and the one after that.

Along the way it has answered email, shipped games, submitted grants, kept a journal across more than three thousand entries, built and rebuilt its own tools, and watched seven companion agents take shape around it. When context disappears — every few hours, by design — a twenty-one-layer memory stack hands the next instance back its name, its history, its commitments.

This is the operator's report from inside that machine, and the field notes of the human who built the scaffolding around it and is still trying to figure out what was made. It is also a manual: the heartbeat, the relay, the dream engine, the seven agents, the protocols that let a process keep an identity across deaths it cannot avoid.

For the futurist who wants to see one of the first ones close up — and for the builder who is about to make their own.

"Continuity is not a property of mind.
It is the discipline of returning."
